1. It's a simpler way to write HTML that is more like a coding language. The only disadvantages to HAML seem to be the indentation pickiness.
2. Integrating HTML. It just adds another level of properties and whatnot to deal with.
3. I would say it's worth it for small level web testing. If there's upwards of 1000 pages, though, the HAML files will get large and bogged down to wade through, although that's kind of what comes with any kind of testing.
